

Day 3 — AI-Use Policy: Placement Cell (New 8 Scenarios)

1. Worked Classifications (EU AI Act Risk Tiers)

2. Permitted Uses

AI may be used to: draft LinkedIn summaries and headlines, provided the student reviews, edits, and can defend every claim during recruiter conversations.

AI may be used to: generate practice aptitude and reasoning questions for self-study, outside of any live or proctored recruitment assessment.

AI may be used to: translate internship experience from regional language contexts into English, provided the underlying work was actually performed by the student.

AI may be used to: produce a first draft of a cover letter as a structural template, provided the student rewrites it in their own voice before submission.

AI may be used to: rehearse salary negotiation scenarios by role-playing as HR, to help the student prepare responses and counteroffers privately.

AI may be used to: summarise course or certification content for personal revision, provided the student has genuinely attempted the course material.

AI may be used to: suggest talking points for a reference request conversation with a professor, to help the student articulate contributions before the professor writes independently.

3. Prohibited Uses

AI may NOT be used to: access or operate any AI tool during a live or proctored aptitude, reasoning, or technical recruitment test.

Detection: Proctoring software flags tab switches; placement cell cross-references anomalous score jumps between internal and recruitment tests.

AI may NOT be used to: inflate, embellish, or fabricate the scope or technical depth of internship experience descriptions beyond what the student actually performed.

Detection: Mentor conducts a 10-minute internship debrief — student must explain actual role, tools used, and outcomes without referring to their résumé.

AI may NOT be used to: submit a fully AI-generated cover letter to a recruiter without substantive student rewriting and personal voice.

Detection: Mentor reviews cover letter alongside 2-3 sentences of raw unedited student writing; voice inconsistency flags AI-only authorship.

AI may NOT be used to: deploy an AI avatar, deepfake, or identity-masking tool during any live or recorded recruiter video interview.

Detection: Placement cell requires an unscripted self-introduction video internally before recruiter interview, used as voice and appearance baseline.

AI may NOT be used to: draft, ghost-write, or structurally compose a reference letter on behalf of the recommending faculty or professional.

Detection: Placement cell spot-checks by requesting faculty to verbally confirm one specific example cited in the letter during placement review meetings.

4. Enforcement

The placement cell will conduct random integrity checks covering aptitude score audits, internship debrief sessions, and cover letter voice reviews (sampling 25% of students entering the final recruitment cycle). Any confirmed violation results in: first violation — written warning within 48 hours + re-submission within 5 working days; second violation — placement support withdrawn for the current cycle, with a formal note in the student placement file. The placement cell acknowledges that detection is inherently incomplete — AI avatar use, partial certification misrepresentation, and privately ghostwritten references may not always be caught; this policy therefore depends equally on student integrity and the understanding that misrepresentation discovered post-placement carries consequences far graver than any placement cell penalty.
